Description

The AMT2542012 is a wideband Reflective single-pole; double throw (SPDT) MMIC chip covering DC to 10GHz. The Switch offers high Isolation and Low Insertion Loss. The Switch features greater than 50 dB Isolation and less than 2.0 dB Insertion Loss up to 10GHz. The Switch offers a high speed switching due to the presence of an on-chip TTL Driver. The input power for 1dB gain compression is 21dBm at midband. The switch operates on +5V/-5V supplies with minimal DC power consumption and is controlled using TTL compatible voltage levels. The die is fabricated using a robust 0.5µm InGaAs pHEMT technology.

Recommended Assembly Diagram

Note:

1. Two 1-mil (0.0254mm) bond wires of minimum length ($< 250\mu\text{m}$) should be used for all RF ports.
2. All RF ports are DC Coupled.
3. 0.1 μF capacitors may be additionally used as a bypass for reliable operation at the power supplies.
4. Input and output 50 ohm lines are on either 5mil or 10mil Alumina or RT Duroid substrate.

Die attach: For Epoxy attachment, use of a two-component conductive epoxy is recommended. An epoxy fillet should be visible around the total die periphery. If Eutectic attachment is preferred, use of fluxless AuSn (80/20) 1-2 mil thick preform solder is recommended. Use of AuGe preform should be strictly avoided.

Wire bonding: For DC pad connections use either ball or wedge bonds. For best RF performance, use of 150 - 200 μm length of wedge bonds is advised. Single Ball bonds of 250-300 μm though acceptable, may cause a deviation in RF performance.

GaAs MMIC devices are susceptible to Electrostatic discharge. Proper precautions should be observed during handling, assembly & testing
